Foreword

The International ~~Organization~~-~~Organisation~~ of Legal Metrology (OIML) is a worldwide, intergovernmental ~~organization~~-~~organisation~~ whose primary aim is to ~~harmonize~~-~~harmonise~~ the regulations and metrological controls applied by the national metrological services, or related ~~organizations~~~~organisations~~, of its Member States. The main categories of OIML publications are:

- **International Recommendations (OIML R)**, which are model regulations that establish the metrological characteristics required of certain measuring instruments and which specify methods and equipment for checking their conformity. OIML Member States shall implement these Recommendations to the greatest possible extent;
- **International Documents (OIML D)**, which are informative in nature and which are intended to ~~harmonize~~-~~harmonise~~ and improve work in the field of legal metrology;
- **International Guides (OIML G)**, which are also informative in nature and which are intended to give guidelines for the application of certain requirements to legal metrology;
- **International Basic Publications (OIML B)**, which define the operating rules of the various OIML structures and systems; and

OIML Draft Recommendations, Documents and Guides are developed by Project Groups linked to Technical Committees or Subcommittees which comprise representatives from OIML Member States. Certain international and regional institutions also participate on a consultation basis. Cooperative agreements have been established between the OIML and certain institutions, such as ISO and the IEC, with the objective of avoiding contradictory requirements. Consequently, manufacturers and users of measuring instruments, test laboratories, etc. may simultaneously apply OIML publications and those of other institutions.

International Recommendations, Documents, Guides and Basic Publications are published in English (E) and translated into French (F) and are subject to periodic revision.

Additionally, the OIML publishes or participates in the publication of **Vocabularies (OIML V)** and periodically commissions legal metrology experts to write **Expert Reports (OIML E)**. Expert Reports are intended to provide information and advice, and are written solely from the viewpoint of their author, without the involvement of a Technical Committee or Subcommittee, nor that of the CIML. Thus, they do not necessarily represent the views of the OIML.

This publication – reference OIML D 5, edition xxxx (E) – was developed by the OIML Technical Committee TC 4 *Measurement standards and calibration and verification devices*. It was approved for final publication by the International Committee of Legal Metrology at its xx meeting in xxxxxx 20xx [and will be submitted to the International Conference on Legal Metrology in 20xx for formal sanction](#).

OIML Publications may be downloaded from the OIML web site in the form of PDF files. Additional information on OIML Publications may be obtained from the ~~Organization's~~-~~Organisation's~~ headquarters:

1 Introduction

- 1.1 The discipline and function of metrology in general, and legal metrology particularly, have changed significantly ~~in over the last twenty~~ 20 years, both at national and international levels. Metrology is facing multiple developments such as the globalisation of economics and international trade, digitalisation of geopolitical changes, elimination of technical barriers to trade, liberalisation, privatisation and redefinition of the role of metrology.

Metrology also evolves together with implementation of quality management systems in various organisations, accreditation of testing and calibration laboratories, and conformity assessment procedures based on the production quality system ~~of production~~. The quality of products and services is increasingly dependent on reliable measurements.

- 1.2 ~~M~~The measurements are important ~~to for~~ conformity assessment, specifically in legal metrology, which is based on ~~the~~ requirements for the legal control of measuring instruments. ~~M~~The metrological traceability enters into legal metrology as a part of conformity assessment. The results of measurements covered by regulations shall be expressed in legal units and shall be traceable to the SI [9].

The importance attached to measurements is also reflected in relevant international measurement standards by the requirement that measurement ~~results~~ shall be traceable to the SI through national ~~realisations-realizations~~ in National Metrology Institutes (NMI) which can be referred to as national or international measurement standards. So, for example, according to ISO/IEC 17025:2017 [1], when the measurement accuracy and measurement uncertainty affect the validity of the reported result, or metrological traceability is a requirement, measuring equipment shall be calibrated before being placed into service. ~~The calibration program for equipment shall ensure that all results obtained by the laboratory are metrologically traceable to SI units. The calibration program for equipment shall ensure that all calibrations and measurements made by the laboratory are metrologically traceable to the SI units.~~

In line with another standard, ISO 9001:2015 [8], when measurement ~~result~~ traceability is a requirement, or is considered by the ~~organization-organisation~~ to be an essential part of providing confidence in the validity of measurement results, measuring equipment shall be calibrated or verified at specified intervals or prior to use, ~~against measurement standards having values that are traceable to values for international or national measurement standards against measurement standards traceable to international or national measurement standards.~~

- 1.3 ~~Metrological traceability is based in part on demonstrated equivalence among national measurement standards, as stated~~ Metrological traceability is based on the one hand on calibrations, traceable to national measurement standards, particularly those that are primary measurement standards and international measurement standards, and on the other hand on equivalence between national measurement standards, as stated in joint BIPM, OIML, ILAC and ISO declarations on the relevance of Mutual Recognition Arrangements (MRAs~~s~~) [6] and on metrological traceability [7].

- 1.4 This traceability of measurement ~~results~~ is essential if the results of the measurements and the claim on the applicable measurement uncertainty are to be comparable and meaningful. National measurement systems provide the framework within which all ~~measurements-values~~ necessary for the proper performance of a calibration, testing or verification are traceable to the SI or, if this is not possible, to values for nationally or internationally agreed reference materials.

- 1.5 The quest for improved measurement quality is the main reason for the existence of hierarchy schemes. While the quality is achievable in a number of ways, the classical scheme based on a direct calibration chain is widely used. ~~Achievable in a number of ways, the classical scheme that is based on the direct calibration chain is the most widely used.~~

- 1.6 In legal metrology, special precaution must be taken for a complete estimation of the measurement uncertainty to ensure the traceability of the measurement values. Verification is sometimes conducted without the corresponding measurement uncertainty estimation. Where verification is performed without consideration of the measurement uncertainty, then it may not be considered to preserve or assure traceability. ~~In legal metrology, a special precaution is needed to the treatment of uncertainty. Verification is sometimes conducted without considering the uncertainty of the measuring instrument and/or the standard used for the verification. Such a verification is not considered to assure a traceability.~~ Refer to OIML Guide-G 19 [11] for consideration of measurement uncertainty in legal metrology.

2 Scope

- 2.1 This ~~document~~ Document deals with the principles and methods of metrological traceability ~~and describes methods to achieve metrological traceability.~~ It proposes general rules for the establishment of hierarchy schemes for measuring instruments ~~-including as a specification of calibration chains and methods of calibration for measuring instruments (including means and methods~~ for the dissemination of units. ~~The schemes), which then serves as evidence of their the~~ metrological traceability.
- 2.2 This Document ~~gives~~ provides guidance and assistance to organisations on how to comply with the metrological traceability requirements for relevant standards. It is intended for legal metrology laboratories where supervision of measuring and test equipment is an important part of quality assurance. It may be used by organisations involved in industrial production processes (development, manufacture, installation, final inspection) and by calibration and testing laboratories.
- 2.3 Depending on the circumstances, other ways of achieving metrological traceability than those described herein may be applicable. These are not discussed in this Document, but may be described in other International Documents.

3 Terminology

Unless otherwise stated in the following sub-clauses, the terminology used in this Document conforms to the VIML [3], the VIM [2] and the GUM [4].

For the purpose of this Document, the definitions and abbreviations given below apply.

3.1 International System of Units

SI (VIM, 1.16)

system of units, based on the International System of Quantities, their names and symbols, including a series of prefixes and their names and symbols, together with rules for their use, adopted by the General Conference on Weights and Measures (CGPM)

For notes see (VIM, 1.16).

3.2 metrology (VIM, 2.2)

science of measurement and its application

~~NOTE~~ Note: Metrology includes all theoretical and practical aspects of measurement, whatever the measurement uncertainty and field of application.

3.3 measurement uncertainty (VIM, 2.26)

uncertainty of measurement

uncertainty

non-negative parameter characterising the dispersion of the quantity values being attributed to a measurand, based on the information used

Note 1: Measurement uncertainty includes components arising from systematic effects, such as components associated with corrections and the assigned quantity values of measurement standards, as well as the definitional uncertainty. Sometimes estimated systematic effects are not corrected for but, instead, associated measurement uncertainty components are incorporated.

Note 2: The parameter may be, for example, a standard deviation called standard measurement uncertainty (or a specified multiple of it), or the half-width of an interval, having a stated coverage probability.

Note 3: Measurement uncertainty comprises, in general, many components. Some of these may be evaluated by Type A evaluation of measurement uncertainty from the statistical distribution of the quantity values from series of measurements and can be characterised by standard deviations. The other components, which may be evaluated by Type B evaluation of measurement uncertainty, can also be characterized by standard deviations, evaluated from probability density functions based on experience or other information.

Note 4: In general, for a given set of information, it is understood that the measurement uncertainty is associated with a stated quantity value attributed to the measurand. A modification of this value results in a modification of the associated uncertainty.

3.3.4 calibration (VIM, 2.39)

operation that, under specified conditions, in a first step, establishes a relation between the quantity values with measurement uncertainties provided by measurement standards and corresponding indications with associated measurement uncertainties and, in a second step, uses this information to establish a relation for obtaining a measurement result from an indication

For notes see (VIM, 2.39).

3.4.3.5 calibration hierarchy (VIM, 2.40)

sequence of calibrations from a reference to the final measuring system, where the outcome of each calibration depends on the outcome of the previous calibration

For notes see (VIM, 2.40).

3.5.3.6 metrological traceability (VIM, 2.41)

property of a measurement result whereby the result can be related to a reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty

~~NOTE~~ *Note 1:* For this definition, a ‘reference’ can be a definition of a measurement unit through its practical realization, or a measurement procedure including the measurement unit for a non-ordinal quantity, or a measurement standard.

~~NOTE~~ *Note 2:* Metrological traceability requires an established calibration hierarchy.

For other notes see (VIM, 2.41).

3.6.3.7 metrological traceability chain, traceability chain (VIM, 2.42)

sequence of measurement standards and calibrations that is used to relate a measurement result to a reference

~~NOTE~~ *Note 1:* A metrological traceability chain is defined through a calibration hierarchy.

~~NOTE~~ *Note 2:* A metrological traceability chain is used to establish metrological traceability of a measurement result.

~~NOTE~~ *Note 3:* A comparison between two measurement standards may be viewed as a calibration if the comparison is used to check and, if necessary, correct the quantity value and measurement uncertainty attributed to one of the measurement standards.

3.73.8 metrological traceability to a measurement unit, metrological traceability to a unit (VIM, 2.43) metrological traceability where the reference is the definition of a measurement unit through its practical ~~realization~~realisation

Note: The expression “traceability to the SI” means ‘metrological traceability to a measurement unit of the International System of Units’.

~~3.8 — verification (VIM, 2.44)~~
~~provision of objective evidence that a given item fulfils specified requirements~~

~~For examples and notes see (VIM, 2.44)~~

3.9 measuring instrument (VIM, 3.1)

device used for making measurements, alone or in conjunction with one or more supplementary devices

~~NOTE~~ *Note 1:* A measuring instrument that can be used alone is a measuring system.

~~NOTE~~ *Note 2:* A measuring instrument may be an indicating measuring instrument or a material measure.

3.10 measuring system (VIM, 3.2)

set of one or more measuring instruments and often other devices, including any reagent and supply, assembled and adapted to give information used to generate measured quantity values within specified intervals for quantities of specified kinds

Note: A measuring system may consist of only one measuring instrument.

3.103.11 indicating measuring instrument (VIM, 3.3)

measuring instrument providing an output signal carrying information about the value of the quantity being measured

Examples: Voltmeter, micrometer, thermometer, electronic balance.

Note 1: An indicating measuring instrument may provide a record of its indication.

Note 2: An output signal may be presented in visual or acoustic form. It may also be transmitted to one or more other devices.

3.113.12 material measure (VIM, 3.6)

measuring instrument reproducing or supplying, in a permanent manner during its use, quantities of one or more given kinds, each with an assigned quantity value

Examples: Standard weight, volume measure (supplying one or several quantity values, with or without a quantity-value scale), standard electric resistor, line scale (ruler), gauge block, standard signal generator, certified reference material.

Note 1 The indication of a material measure is its assigned quantity value.

Note 2 A material measure can be a measurement standard.

3.123.13 measurement standard

etalon (VIM, 5.1)

~~realization~~ ~~realisation~~ of the definition of a given quantity, with stated quantity value and associated measurement uncertainty, used as a reference

For examples and notes see (VIM, 5.1).

3.14 national measurement standard

national standard (VIM, 5.3)

measurement standard recognised by a national authority to serve in a state or economy as the basis for assigning quantity values to other measurement standards for the kind of quantity concerned

3.15 primary measurement standard

primary standard (VIM, 5.4)

measurement standard established using a primary reference measurement procedure, or created as an artifact, chosen by convention

For examples see (VIM, 5.4).

3.133.16 reference measurement standard

reference standard (VIM, 5.6)

measurement standard designated for the calibration of other measurement standards for quantities of a given kind in a given ~~organization~~ ~~organisation~~ or at a given location

3.143.17 working measurement standard

working standard (VIM, 5.7)

measurement standard that is used routinely to calibrate or verify measuring instruments or measuring systems

Note 1: A working measurement standard is usually calibrated with respect to a reference measurement standard.

Note 2: In relation to verification, the terms “check standard” or “control standard” are also sometimes used.

3.153.18 reference material

— **RM** (VIM, 5.13)

material, sufficiently homogeneous and stable with reference to specified properties, which has been established to be fit for its intended use in measurement or in examination of nominal properties

For examples and notes see (VIM, 5.13).

3.19 certified reference material

CRM (VIM, 5.14)

reference material, accompanied by documentation issued by an authoritative body and providing one or more specified property values with associated uncertainties and traceabilities, using valid procedures

For examples and notes see (VIM, 5.14).

3.20 maximum permissible measurement error

maximum permissible error

limit of error (VIML, 0.05)

extreme value of measurement error, with respect to a known reference quantity value, permitted by specifications or regulations for a given measurement, measuring instrument, or measuring system

Note 1: Usually the term “maximum permissible errors” or “limits of error” are used, where there are two extreme values.

Note 2: The term “tolerance” should not be used to designate ‘maximum permissible error’.

[OIML V2-200:2012, 4.26]

Note 3: Usually the term “maximum permissible error” is abbreviated to “MPE”, or “mpe”.

3.163.21 legal metrology (VIML, 1.01)

practice and process of applying statutory and regulatory structure and enforcement to metrology

Note 1: The scope of legal metrology may be different from country to country.

Note 2: Legal metrology includes

- setting up legal requirements,
- control / conformity assessment of regulated products and regulated activities,
- supervision of regulated products and of regulated activities, and
- providing the necessary infrastructure for the traceability of regulated measurements and measuring instruments to SI or national standards.

Note 3: There are also regulations outside the area of legal metrology pertaining to the accuracy and correctness of measurement methods.

3.173.22 legal control of measuring instruments (VIML, 2.02)

generic term used to globally designate legal operations to which measuring instruments may be subjected, e.g. type approval, verification, etc.

3.23 type approval (VIML, 2.05)

decision of legal relevance, based on the review of the type evaluation report, that the type of a measuring instrument complies with the relevant statutory requirements and results in the issuance of the type approval certificate

Note: See also VIML, A.25.

3.24 verification of a measuring instrument (VIML, 2.09)

conformity assessment procedure (other than type evaluation) which results in the affixing of a verification mark and/or issuing of a verification certificate

Note: See also OIML V2-200:2012, 2.44.

3.183.25 hierarchy scheme

descriptive and graphical specification of metrological traceability chain for a given kind of measuring instrument which serves to evidence their metrological traceability

3.193.26 national hierarchy scheme

hierarchy scheme for a given kind of measuring instruments in the particular country, containing the specification of the recommended (permissible) kinds of measuring instruments for individual levels of metrological traceability, requirements for their metrological characteristics and recommended (permissible) methods and means of dissemination of units

3.203.27 local hierarchy scheme

hierarchy scheme for a given kind of measuring instruments at a given location, in a given organisation or in a given laboratory, containing the specification of the reference and working standards, their metrological characteristics and the methods and means of dissemination of units

3.213.28 means of ~~units~~ dissemination of units

technical devices, reference materials or material measures, which are necessary to carry out calibration by comparing the measurement standards and the measuring instruments to be calibrated.

Note: These means influence uncertainties of dissemination of units.

3.223.29 National Metrology Institute (~~Designated Institute~~ ~~National Standard Laboratory,~~ ~~Designated Laboratory~~)

institute in a country that has a responsibility, sometimes set out legally, for the conservation of one or more national measurement standards

~~NOTE~~ *Note 1:* The recommended role of a National Metrology Institute (NMI) is described in detail in ~~3.2.3 of the~~ OIML D 1:2012, 3.2.3 [10].

Note 2: The recommended role of a Designated Institute (DI) is described in CIPM 2005-07 [14] and CIPM 2005-06 (V4) [15].

3.233.30 legal metrology laboratory (legal metrology services)

laboratory of an ~~authorized~~ ~~authorised~~ institute responsible for a legal control of measuring instruments, e.g. type approval, verification, etc.

~~Note~~*Note 1:* The recommended role of such an institute is described in detail in ~~3.2.2.3~~ of the OIML D 1:2012, 3.2.2.3 [10].

Note 2: Legal metrology laboratories are generally laboratories of the state legal metrology services or private metrology laboratories charged (authorised) by the national (legal) metrology authority to carry out legal control of measuring instruments within a defined scope.

DRAFT

3.253.31 accredited calibration laboratory

laboratory that performs calibration of measuring instruments and **that** is formally recognised by an accreditation authority and **that** is competent to carry out the calibration (e.g. competence in accordance with ISO/IEC 17025:2017 [1])

4 Metrological traceability and its elements**4.1 Objectives of metrological traceability**

4.24.1.1 Metrological traceability of the results obtained through the use of measuring and test equipment by means of traceable calibration or verification is necessary ~~in order:~~

- a) to meet the requirements of growing national and international trade;
- b) to guarantee the product quality and compatibility of manufactured parts;
- c) to protect the interests of individuals and enterprises,
- ~~e)d)~~ to protect national interests; **and**
- ~~d)e)~~ to protect public health and safety, including **the** environment, medical and related services.

4.2 Application in legal metrology

4.34.2.1 To provide the metrological traceability for the application of legal metrology control, the evaluation of the measurement uncertainty may be necessary. ~~For the application of legal metrology control, metrological traceability may be obtained through evaluation of measurement uncertainty. Compliance with prescribed maximum permissible error should not be considered to assure the traceability.~~

4.3 Other legal applications

~~**4.4** For the application of any laws and regulations prescribing requirements on measurements, on prepackages and on measuring instruments, the metrological traceability to SI units is required and may be obtained.~~

4.3.1 For the application of any laws and regulations prescribing requirements on measurements, on prepackages and on measuring instruments, metrological traceability to SI units is required and may be obtained through the system of national measurement standards and certified reference materials provided either by local sources or by any other internationally recognised sources.

- ~~a) either through the system of national measurement standards and certified reference materials, or~~
- ~~b) through traceability to recognised national measurement standards or certified reference materials of other countries.~~

4.4 Metrological traceability

4.4.1 The term “metrological traceability” means that the indication of an indicating measuring instrument (or a material measure) has been compared, in one or more stages, with ~~a national measurement standard~~ **realisation of the SI** for the measurand in question. In each of these stages, a calibration has been performed using a measurement standard for which **the** value and uncertainty ~~are~~ **have** already **been** determined by calibration with a higher-level standard. Therefore there is a hierarchy of calibrations as shown in Fig. 1.

The following essential elements are important to metrological traceability within the context of legal metrology:

- a) Measurement uncertainty: the measurement uncertainty for each step in the metrological traceability chain shall be calculated according to agreed methods, based on the GUM [4]

and shall be stated in such a way that an overall uncertainty for each subsequent stage of the chain may be calculated.

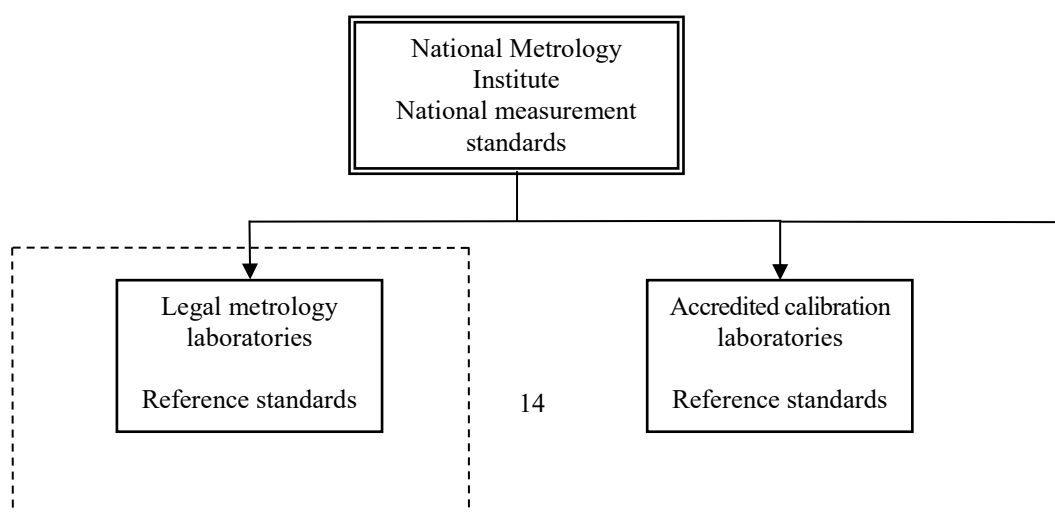

- b) Documentation: each step in the chain shall be performed according to documented and generally acknowledged procedures; the results shall also be documented.
- c) Competence; the laboratories performing one or more steps in the chain shall supply evidence in support of their technical competence (equipment, skills of personnel, environmental conditions, etc.) and shall be accredited.
- d) Reference to SI units: the unbroken chain of calibrations shall end at primary standards for the realisation of the SI units or at measurement standards, against which metrological traceability to primary standard is demonstrable (as far as technically possible or applicable).
- e) Recalibration: calibration shall be repeated at specified intervals depending upon a number of variables, e.g. uncertainty required, frequency of use, way of use, stability of equipment and this information shall be stated in the documentation of the standard.
- f) Initial verification: verification of a measuring instrument which has not been verified previously.
- g) Subsequent verification: verification of a measuring instrument after a previous verification carried out periodically at specified intervals according to the procedure laid down by the regulations.

4.5

4.6

4.5 Maximum permissible error

4.74.5.1 For practical reasons, especially ~~in for the legal metrology~~ verifications in legal metrology or ~~in for the case of repeated standard or routine calibrations~~, a maximum permissible error (MPE) of the measurement standard (or measuring instrument) indications is specified instead of the measurement uncertainty ~~the maximum permissible error (MPE) of measurement standard (or measuring instrument) indications is specified~~. In such a case, the MPE should be defined ~~in consideration of~~ taking into account the measurement uncertainty. However, compliance with the prescribed maximum permissible error alone should not necessarily be considered to ensure traceability.

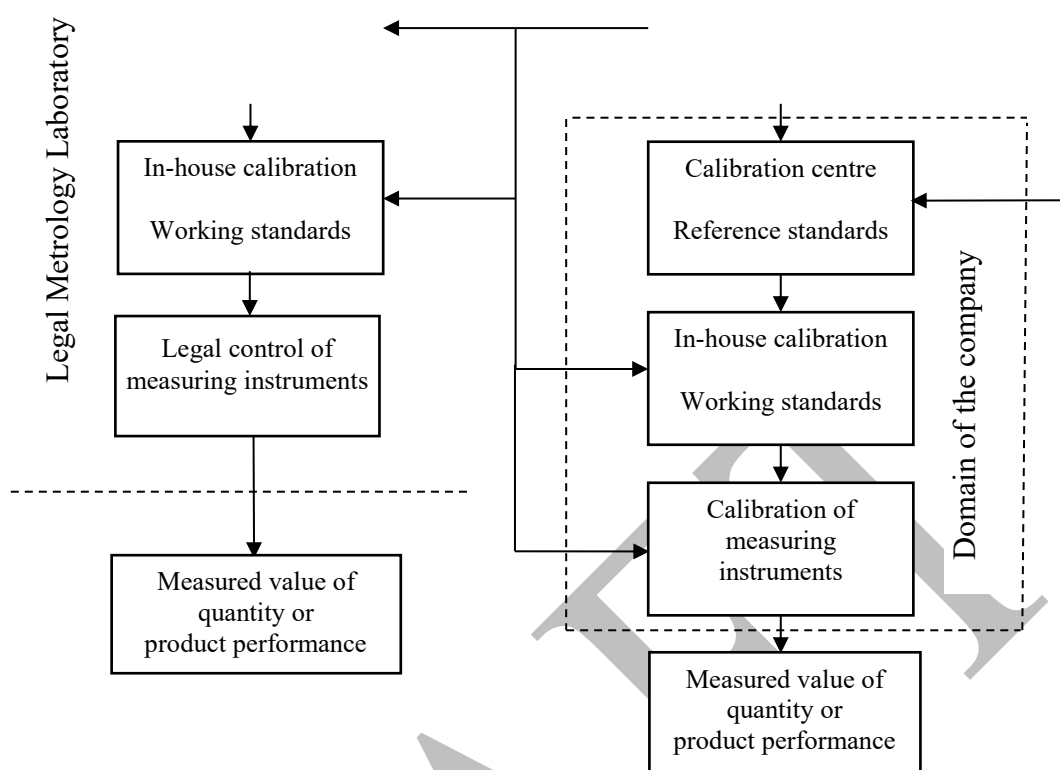

Fig. 1 Hierarchy of calibrations

4.8 — Metrological traceability is characterised by a number of essential elements:

- a) — an unbroken chain of dissemination of units going back to a measurement standard acceptable to the parties, usually national measurement standards;
- b) — measurement uncertainty; the measurement uncertainty for each step in the metrological traceability chain shall be calculated according to (agreed methods, based on) the “Guide to the expression of uncertainty in measurement” [4] and shall be stated in such a way that an overall uncertainty for each following stage of the chain may be calculated;
- c) — documentation; each step in the chain shall be performed according to documented and generally acknowledged procedures; the results shall equally be documented;
- d) — competence; the laboratories performing one or more steps in the chain shall supply evidence for their technical competence (equipment, skills of personnel, environmental conditions, etc.);
- e) — reference to SI units; the chain of calibrations shall end at primary standards for the realisation of the SI units or at measurement standards, on which metrological traceability to primary standard is demonstrable (as far as technically possible or applicable);
- f) — re-calibrations; calibrations shall be repeated at regular intervals depending upon a number of variables, e.g. uncertainty required, frequency of use, way of use, stability of equipment and it should be stated in the documentation of the standard;
- g) — initial verification; verification of a measuring instrument which has not been verified previously
- subsequent verification; verification of a measuring instrument after a previous verification carried out periodically at specified intervals according to the procedure laid down by the regulations.

4.6 Elements of metrological traceability

4.6.1 Reference and working standards and means of dissemination of units have to be provided by documentation in accordance with the valid regulations. The basic document for these measurement standards and means of dissemination of units is the valid calibration certificate issued either by an accredited calibration laboratory or by a laboratory demonstrating metrological traceability to the national measurement standard. Other important parts of metrological traceability documentation are calibration or verification methods and procedures, which must clearly describe the metrological traceability of the measurement results. That is, the procedures have to clearly define which measurement standards and means of dissemination of units are used for the traceability. These procedures must also state the detailed procedure for evaluating uncertainties of calibrated or verified measuring instruments.

4.7 Reference materials

4.94.7.1 In many fields, reference materials ~~play~~**take** the role of reference and working standards. It is equally important that **values assigned** for such reference materials are traceable to relevant SI units ~~realised~~**realised** by national or international measurement standards. Certification of reference materials is a method that is often used to demonstrate metrological traceability to national or international measurement standards.

Note 1: Additional information on the reference materials can be found in ISO 17034:2016 [16] or ISO Guide 35:2017 [17].

~~*Note 1:* Reference and working standards and means of dissemination of units have to be provided by documentation in accordance with valid regulations. The basic document for these measurement standards and means of dissemination of units is the valid calibration certificate issued either by accredited calibration laboratory or by laboratory demonstrating metrological traceability to national measurement standard.~~

Note 2: Reference materials produced by accredited RMPs (Reference materials producers) as per ISO 17034:2016 [16] are also considered as traceable to national or international standards.

~~*Note 2:* The important parts of metrological traceability documentation are calibration or verification methods and procedures. Calibration or verification procedures have to clearly describe metrological traceability of measurements. That is, the procedures have to clearly define which measurement standards and means of dissemination of units are used for the traceability. At the same time these procedures have to state the detailed procedure for evaluating uncertainties of calibrated or verified measuring instruments.~~

5 Levels of dissemination of units of measurement

5.1 International level

5.1.1 At the international level, decisions concerning the International System of Units (SI) and the ~~realisation~~**realization** of the primary standards are taken by the Conférence Générale des Poids et Mesures (CGPM). The Bureau International des Poids et mesures (BIPM) is charged with coordinating the development and maintenance of the realisation of the units and organises key comparisons (intercomparisons on the highest level).~~The Bureau International des Poids et Mesures (BIPM) is charged with coordinating the development and maintenance of primary standards and organises intercomparisons on the highest level.~~

5.2 National ~~metrology~~**Metrology institutes**~~Institutes~~ (NMI)

5.2.1 The National Metrology Institutes are the highest authorities in metrology in almost all countries. ~~The National Metrology Institute~~ NMIs represents the country internationally in relation to the ~~National Metrology Institutes~~ NMIs of other countries, ~~in relation to~~ the Regional Metrology Organisations and ~~to~~ the BIPM. Some countries have a single ~~authorized~~ authorised institute as their ~~National Metrology Institute~~ NMI, whereas others ~~countries~~ have a more distributed national metrological system (e.g. including one or more Designated Institutes).-

5.2.2 In most cases the ~~National Metrology Institutes~~ NMIs maintain the national measurement standards of the country that are the sources of metrological traceability for the associated physical quantities in that country. ~~In some cases, the metrological traceability is to the measurement standards maintained by BIPM.~~ If the ~~National Metrology Institute~~ NMI has facilities and skills to ~~realise~~ realise the corresponding SI base units and derived units of measurement (the term SI unit includes all derived units), the national measurement standards may be ~~identical to~~ equivalent to the primary standards ~~realising~~ realising the units. If the ~~National Metrology Institute~~ NMI does not have this facility, it shall ensure that the measurement results are traceable to ~~a primary standard~~ the SI through the standards maintained in another country, preferably to measurement standards ~~realized~~ realised at an ~~National Metrology Institute~~ NMI which is a ~~signature~~ signatory to the Mutual Recognition Arrangement of the Comité International des Poids et Mesures (CIPM MRA). If this condition is fulfilled, ~~is so,~~ then the calibration certificates issued by this ~~National Metrology Institute~~ NMIs ensure that the realisation of the units ~~primary standards~~ themselves are internationally compared within the framework of the CIPM MRA. They are responsible for dissemination of the units of measurement to users, scientists, public authorities, laboratories or industrial enterprises and are therefore at the top level of the metrological infrastructure in a country.

Metrological traceability to the standards maintained by NMIs may be checked by reference to the calibration and measurement capabilities of NMIs held on the BIPM's key comparison database (KCDB) published on the BIPM web site (www.bipm.org).

~~5.2.2~~

5.3 Accredited calibration laboratories

5.3.1 Calibration laboratories ~~in industry and other organisations~~ accredited by national accreditation bodies according to internationally established criteria (e.g. ~~in accordance with~~ ISO/IEC 17025:2017 [1]) shall be able to demonstrate that the calibration of ~~critical equipment~~ measuring instruments and ~~hence their measurement results, relevant to their scope of accreditation are~~ is traceable to SI units ~~(as far as technically possible or as far as applicable).~~

5.3.1 *Note:* Some calibration laboratories indicate that their service is covered by the ILAC Mutual Recognition Arrangement (ILAC MRA) by including the ILAC Laboratory Combined MRA mark on the calibration certificate. Alternatively, the accreditation symbol of the accreditation body that is a signatory to the ILAC MRA and/or a recognised regional MLA may be included on the calibration certificate. Both of these options may be taken as evidence of traceability [18].

5.3.2 Accredited calibration laboratories are often at the top of a firm's internal calibration hierarchy. Their task is to compare, at appropriate intervals, the firm's own working standards with reference standards, which are calibrated by an ~~National Metrology Institute~~ NMI or an accredited laboratory with suitable calibration and measurement capability.

5.3.3 Many accredited laboratories carry out calibrations for third parties, e.g. for organisations that are not equipped with calibration facilities and for private test laboratories as well, which work in the field of product certification. In this case the customer has to be assured that the measurement uncertainty achieved in a laboratory is suitable and sufficient for the intended use of the measuring instrument to be calibrated.

5.3.4 The calibration results are documented in a calibration certificates.

5.4 Legal metrology laboratories

- 5.4.1 Legal metrology laboratories ~~shall~~ should be able to demonstrate that ~~calibration of the measurement standards values and measuring instruments; values used for verification devices and their measurement results~~ are traceable to the SI units within their scope of ~~authorization~~ authorisation according to the national legislation. Their reference standards are calibrated by an ~~National Metrology Institute~~ NMI or an accredited laboratory with suitable calibration and measurement ~~capability~~ capabilities. ~~The metrological traceability to the standards maintained by NMIs may be checked by the reference to calibration and measurement capabilities of NMIs as held on the BIPM's key comparison database published on the BIPM web site (www.bipm.org).~~
- 5.4.2 Legal metrology laboratories or services in some countries are accredited according to ~~the a~~ relevant international standard, e.g. according to ISO/IEC 17025:2017 [1], ~~or according to~~ ISO/IEC 17020:2012 [12], or ISO/IEC 17065:2012 [13].

5.5 In-house calibration

5.5.1 In-house calibration ~~is means~~ regular calibration of working standards, measuring and test equipment used in a metrology laboratory or in a company against its own reference standards that are traceably calibrated at an accredited calibration laboratory, a legal metrology laboratory or an ~~National Metrology Institute~~ **NMI**.

5.5.2 The scope of in-house calibration is at the discretion of the laboratory or company concerned. Even so, the results obtained using the measuring instruments and test equipment should be sufficiently accurate and reliable.

5.6 Hierarchy of measurement standards

5.6.1 The hierarchy of measurement standards and ~~a resulting metrological organisations in a country, which ensures that all results of the tests and measurements are traceable to the SI structure for tracing measurement and test results within a laboratory or a company to national measurement standards in general~~ is shown in Fig. 2.

Measurement standard (measuring equipment)	Responsibility	Tasks	Basis for the legal control, calibration or measurements	Documentation Output of the legal control, calibration and measurements
 National measurement standards	National Metrology Institute (NMI)	To maintain National measurement standards and disseminate the measuring units and calibration of reference standards	Statutory duty to represent SI units and ensure international comparability / CIPM MRA for national measurement standard	Calibration certificate for reference standard
 Reference standards	Legal metrology laboratories and Accredited calibration laboratories and Legal metrology laboratories	Calibration of working standards to safeguard the metrology infrastructure of country	Calibration certificate from NMI or other accredited laboratory	Calibration certificate for working standard
 Working standards	Legal metrology laboratories, accredited calibration laboratories and in-house calibration	Legal control or calibration of ordinary measuring instruments	Calibration certificate from NMI or Legal legal metrology laboratory or accredited laboratory	Calibration or type approval or verification certificate. Type approval or verification or calibration mark
 Ordinary instruments	User	Measurement and tests performed by legally controlled or calibrated measuring instruments, or as a part of quality assurance measures	Verification or calibration certificate or verification or calibration mark of measuring instruments from legal metrology laboratory or accredited calibration laboratory or in-house calibration	Measurement and test results

DRAFT

6 General principles for the establishment of hierarchy schemes, their structure and practical ~~realisation~~realisation

A ~~h~~ierarchy scheme for measuring instruments is a graphically illustrated system of gradually arranged measuring instruments determining the unbroken chains of calibrations from the national measurement standard down to measuring instruments, giving methods of dissemination of units~~;~~, important metrological characteristics and mutual links.

6.1 General principles for the establishment of hierarchy schemes

6.1.1 The hierarchy scheme may cover either the overall field of measurements of a particular quantity or only a defined part of it, which is characterised by one or more of the following specifications:

- a) range of values of measured quantity (e.g. high temperatures, low absolute pressures etc.);
- b) specification of ~~a~~ certain field in the given quantity (e.g. DC voltage measurements as a part of electricity voltage measurements, power of AC current at certain range of frequencies or power of DC current etc.);
- c) ~~kind of~~ measuring instruments (e.g. line length measuring instruments etc.);
- d) measured medium (e.g. gas flow rate, liquid density etc.).

6.1.2 Each hierarchy scheme for measuring instruments should deal with measuring instruments of one quantity or some interrelated quantities. If reference or working standards of other quantities have to be used in the hierarchy scheme of the given quantity, it is recommended to ~~involve~~include them in the scheme.

6.1.3 The hierarchy scheme for measuring instruments of a certain quantity may be divided into a number of autonomous schemes if it leads to its more efficient arrangement and more rational use.

6.1.4 ~~At establishment of~~When the hierarchy scheme is established, it is necessary to specify especially:

- a) ~~the kinds of~~ measuring instruments capable of fulfilling the role of reference and working standards for different values or for different ranges of values of the given quantity;
- b) ~~the~~ number of levels of reference and/or working standards; ~~and~~
- c) ~~the~~ methods and means of dissemination of units.

Note 1: ~~At the point of~~When establishing or reviewing a hierarchy scheme, the relevant authority should review and take into account the experience ~~gained~~s from the operation of existing schemes, at both national and international levels. In this comparative analysis, consideration should be given to the economic and societal context in which the new or revised scheme will be established, to ensure that any such experiences are applicable.

6.1.5 ~~The c~~Choice of ~~kinds of~~ measuring instruments capable of fulfilling the role of reference and working standards is determined by ~~the~~ appropriate level of their metrological and technical characteristics in accordance with the specification stated in OIML D 8 [5].

6.1.6 In order to technically and economically optimise the benefits of the hierarchy scheme the number of levels of reference and/or working standards should be determined by considering at least the following:

- a) ~~the~~ overall number of measuring instruments of the given quantity as regards ~~the~~ kinds of measuring instruments and their metrological characteristics~~;~~;
- b) ~~kinds of~~~~the~~ measuring instruments capable of fulfilling the role of reference and working standards of different accuracy levels, their productivity and the mean values of ~~the~~ intervals between calibrations and ~~the~~ existence of proper methods and means of dissemination of units~~;~~ and
- c) ~~the~~ costs of ~~the~~ equipment, use and conservation of measurement standards and ~~the~~ means of dissemination of units, etc.

6.1.7 The method of calibration indicated in the hierarchy scheme should correspond to one of the following general methods:

- a) direct measurements:
 - ~~(used in verification or calibration of an indicating measuring instrument against a standard measure; or~~
 - a)– ~~used in verification or calibration of~~ a measure against a standard ~~indicating measuring instrument);~~
- b) direct comparison or comparison using a measure (standard ~~of comparison~~):
 - b)– ~~(used in verification or calibration of a measuring instrument against a standard measuring instrument);~~
- c) comparison with the help of a comparator:
 - c)– ~~(used in verification or calibration of a measure against a standard measure);~~
- d) indirect measurements:
 - d)– ~~(used in calibration or verification of measurement standards a measure or measuring instruments using other measurement standards calibrated in terms of other physical quantities connected-related functionally with the a-measurand).~~

6.1.8 ~~In-For the~~ calibration of measurement standards and measuring instruments or ~~in-for the~~ verification of measuring instruments, the characteristics of their uncertainty indicated in the hierarchy scheme are defined by calculations ~~with-taking into~~ consideration ~~of the~~ characteristics of the total uncertainty of the higher-level measurement standard and methods for the dissemination of the unit.

6.1.9 ~~In-For the~~ verification of measuring instruments to determine ~~the-their~~ compliance with the specified requirements, the recommended ratio of the total uncertainty of the measurements standard to ~~that-of the measuring instrument~~ MPE is 1:3 or better (~~i.e., e.g.~~ 1:10).

Note 1: Uncertainty of the measurement ~~standard or measuring instrument~~ means the total uncertainty of all associated measurements carried out in the verification by means of ~~this~~ measurement standards and/or measuring instruments.

6.2 ~~S~~The structure of hierarchy schemes

6.2.1 A hierarchy scheme consists of the graphic part of the scheme and a ~~of~~ commentary ~~of-on~~ the scheme.

6.2.2 The graphic part provides a visual preview ~~on-of the~~ metrological traceability ~~of-by listing the~~ measuring instruments, ~~and-including~~ only basic information on some, ~~from the metrological traceability view,~~ important characteristics. If the graphic part is ~~wide-too large~~ and complicated, it is possible to divide it into sections, while the commentary remains common.

6.2.3 The ~~c~~Commentary ~~of-a to the~~ hierarchy scheme contains ~~all-items of-such as~~ explanations, ~~necessary information on~~ hierarchy levels, metrological traceability, ~~and~~ methods for placing measuring instruments, ~~-i.e., explanations,~~ recommendations and comments ~~concerning the traceability.~~ See 7.4 for the details of its contents.

6.2.4 National hierarchy schemes are usually divided into four fields:

- a) ~~field-of~~ national measurement standards field;
- b) ~~field-of~~ reference standards field;
- c) ~~field-of~~ working standards field;
- d) ~~field-of~~ measuring instruments field.

In local hierarchy schemes the ~~field-of~~ national measurement standards field is usually omitted.

6.2.5 The ~~f~~Field of working standards can be divided into a number of levels according to accuracy. ~~(levels of working standards may by indicated by Arabic numbers where 1st level mark belongs to the measurement standards of highest level in the hierarchy).~~

Note: Levels of working standards may be indicated by Arabic numbers where the 1st level mark belongs to the measurement standards of the highest level in the hierarchy.

6.2.5

6.2.6 Measuring instruments ~~used as standards~~ in the field of measuring instruments ~~are~~ can be divided into a number of levels according to not only their kinds but also to their ~~accuracy~~ accuracies and measurement ranges.

7 Contents and practical ~~realisation~~ realisation of hierarchy schemes

7.1 Content of a national hierarchy scheme

7.1.1 The national hierarchy scheme for a certain kind of measuring instrument contains:

- the name of the scheme, nominal values or ranges of values of quantity;
- the recommended kinds of measuring instruments capable of fulfilling the role of a measurement standard at different accuracy levels and measurement ranges, typical measuring instruments (kinds of verified or calibrated measuring instruments);
- the recommended methods and means of dissemination of units between the measurement standards themselves and the measuring instruments (methods of calibration, calibration devices);
- the recommended graduation of the accuracy level (uncertainties) of the reference and working standards and the measuring instruments; and;
- the links between the elements of the scheme.

7.2 Content of a local hierarchy scheme

7.2.1 The local hierarchy scheme for ~~the~~ a certain kind of measuring instrument contains:

- the name of the laboratory, and the reference and working standards which are traced to the national measurement standards;
- all the elements of the laboratory's metrological traceability (reference and working standards, measuring instruments, means of dissemination of units);
- the range of measurements (nominal values or ranges of values of quantities, ranges of the most important conditions of measurements which define the procedure for the dissemination of the units) of all the measurement standards and measuring instruments indicated in the hierarchy scheme;
- the estimation of the accuracy (uncertainty) characteristics of all the measurement standards, methods and means of dissemination of the units used;
- all ~~used~~ the links used between the elements of the ~~laboratory's~~ ~~aboratory~~ metrological traceability (~~used~~ verification or calibration procedures used);
- the intervals between the calibrations of the measurement standards; and
- the links between the elements of the scheme.

~~g)~~

7.2.2 The local hierarchy scheme for (a) given kind(s) of measuring instruments, along with the measurement procedures for the measurement standards included in the scheme, has to unambiguously demonstrate that all the requirements for metrological traceability in accordance with the relevant regulations and guidelines are fulfilled in the given laboratory.

7.2.2 *Note:* If the reference standards are directly used for legal control or calibration of ordinary measuring instruments, then they also act as working standards.

7.3 -Graphic part of a hierarchy scheme

- 7.3.1 ~~The Name~~-name of the hierarchy scheme is usually given in the header. ~~The f~~Fields ~~of~~ for the national measurement standard, the reference and working standards and for the measuring instruments ~~are-should be~~ separated in the graphic part of the hierarchy scheme by full lines. A ~~d~~Description of the individual fields of the scheme is usually on the left side of the scheme. Horizontal dashed lines separate the individual levels of the standards in the ~~field-of~~ working standards field.
- 7.3.2 ~~The Measurement~~-measurement standards and measuring instruments ~~are-should be~~ presented as rectangles. The designation of the primary standard may be ~~is~~ enclosed in a rectangle formed by a double line.
- 7.3.3 ~~The m~~Methods and means of calibration and verification ~~should be~~are presented either in the ~~field of the~~ measurement standard field to, which a comparison is made, ~~to~~ or at the ~~bottom-lower~~ borderline of this field as ovals.
- 7.3.4 ~~The g~~Graphical representation of the procedure for dissemination ~~of the units should be performs~~ performed in accordance with the following principles (see Annex C ~~as an~~ for examples):
- a) if the calibration or verification of the measurement standard or measuring instrument is carried out by means of two or more measurement standards, solid lines representing the dissemination of the value of the unit (units) to an object of calibration are connected together into a point (e.g. item 8 of Annex C);
 - b) if the calibration or verification of a measurement standard or measuring instrument can be performed by means of any of the two or more methods or by the standards indicated ~~on~~ in the scheme, then the solid lines representing the dissemination of the value of the unit are not connected into a point (e.g. item 6 of Annex C);
 - c) intersection lines (~~to be avoided~~ if it is possible ~~to avoid it~~) are to be shown by a symbol, as ~~it is~~ shown in item 1 of Annex C.
- 7.3.5 The form of expressing ~~of-the~~ metrological characteristics (absolute or relative) of the measurement standards and ~~of~~ measuring instruments in a single hierarchy scheme should be as similar as possible.
- 7.3.6 ~~The d~~Description given in the graphic part of the local hierarchy scheme should contain the following data, especially:
- a) for the measurement standards: kind and name of the measurement standard, identification number of the measurement standard, measurement range, metrological characteristics specifying the measurement standards, the lower limits of the admitted values of the characteristics of their uncertainty, the range of the special condition of measurements;
 - b) for the methods and means of dissemination of units: name of the method, name and identification number of the means of dissemination of the units, characteristics of the uncertainty of the method;
 - c) for the measuring instruments: kinds of the verified or calibrated measuring instruments, their measurement ranges and basic metrological characteristics (accuracy class, ~~the~~ maximum permissible error, etc.).
- 7.3.7 ~~Note 1: The~~A simplified example of a national hierarchy scheme which contains three levels of measurement standards and the field of measuring instruments is given in Annex A. An example of the graphic part of a detailed local hierarchy scheme is given in Annex B.

7.4 Commentary to the hierarchy scheme

- 7.4.1 ~~The c~~Commentary to the hierarchy scheme should contain all the data concerning metrological ~~measuring instruments metrological traceability, including information,~~ requirements and notes, which are not included in the graphic part of the scheme for any other reason and which cannot be ignored from ~~the-a~~ metrological traceability point of view.

7.4.2 ~~The Specification~~ specification of ~~the~~ (reference and working)-standards should at least contain data as follows:

- a) name and identification of ~~the~~ measurement standard;
- b) nominal value(s) or measurement range(s) of ~~the~~ quantity(ies) value(s) reproduced by the standard and the measurement conditions;
- c) information on ~~any~~ important metrological characteristics of ~~the~~ measurement standard (accuracy class, errors, uncertainty of values of quantities reproduced by ~~the~~ measurement standard, time stability of standard etc.).

It is recommended to also include the following data in this specification:

- a) name of ~~the~~ legal metrology laboratory or accredited laboratory ~~to~~, which the reference or working standard is compared ~~to~~;
- b) recalibration interval,
- c) location of the measurement standard.

7.4.3 ~~The s~~Specification of ~~the~~ methods, means and conditions of dissemination of ~~the~~ units should contain at least ~~the following~~ data ~~as follows~~:

- a) means of dissemination of ~~the~~ units – name of device, manufacturer, serial or identification number, and basic metrological characteristics.
- b) method of verification or calibration,
- c) verification or calibration procedure,
- d) uncertainty of verification or calibration,
- e) specified measurement conditions of ~~the~~ verification or calibration (if necessary).

Note 1: Calibration devices which contain several function parts in one compact unit (e.g. multiquantity calibration devices with built in measurement standards for several quantities, multiquantity calibrators etc.) are usually calibrated as a whole. Such devices are usually a part of different working hierarchy schemes. The position of such a device in ~~an~~ individual scheme depends on its measurement ranges and ~~its~~ declared metrological characteristics.

7.4.4 ~~The s~~Specification of ~~the~~ measuring instrument should contain at least the following data:

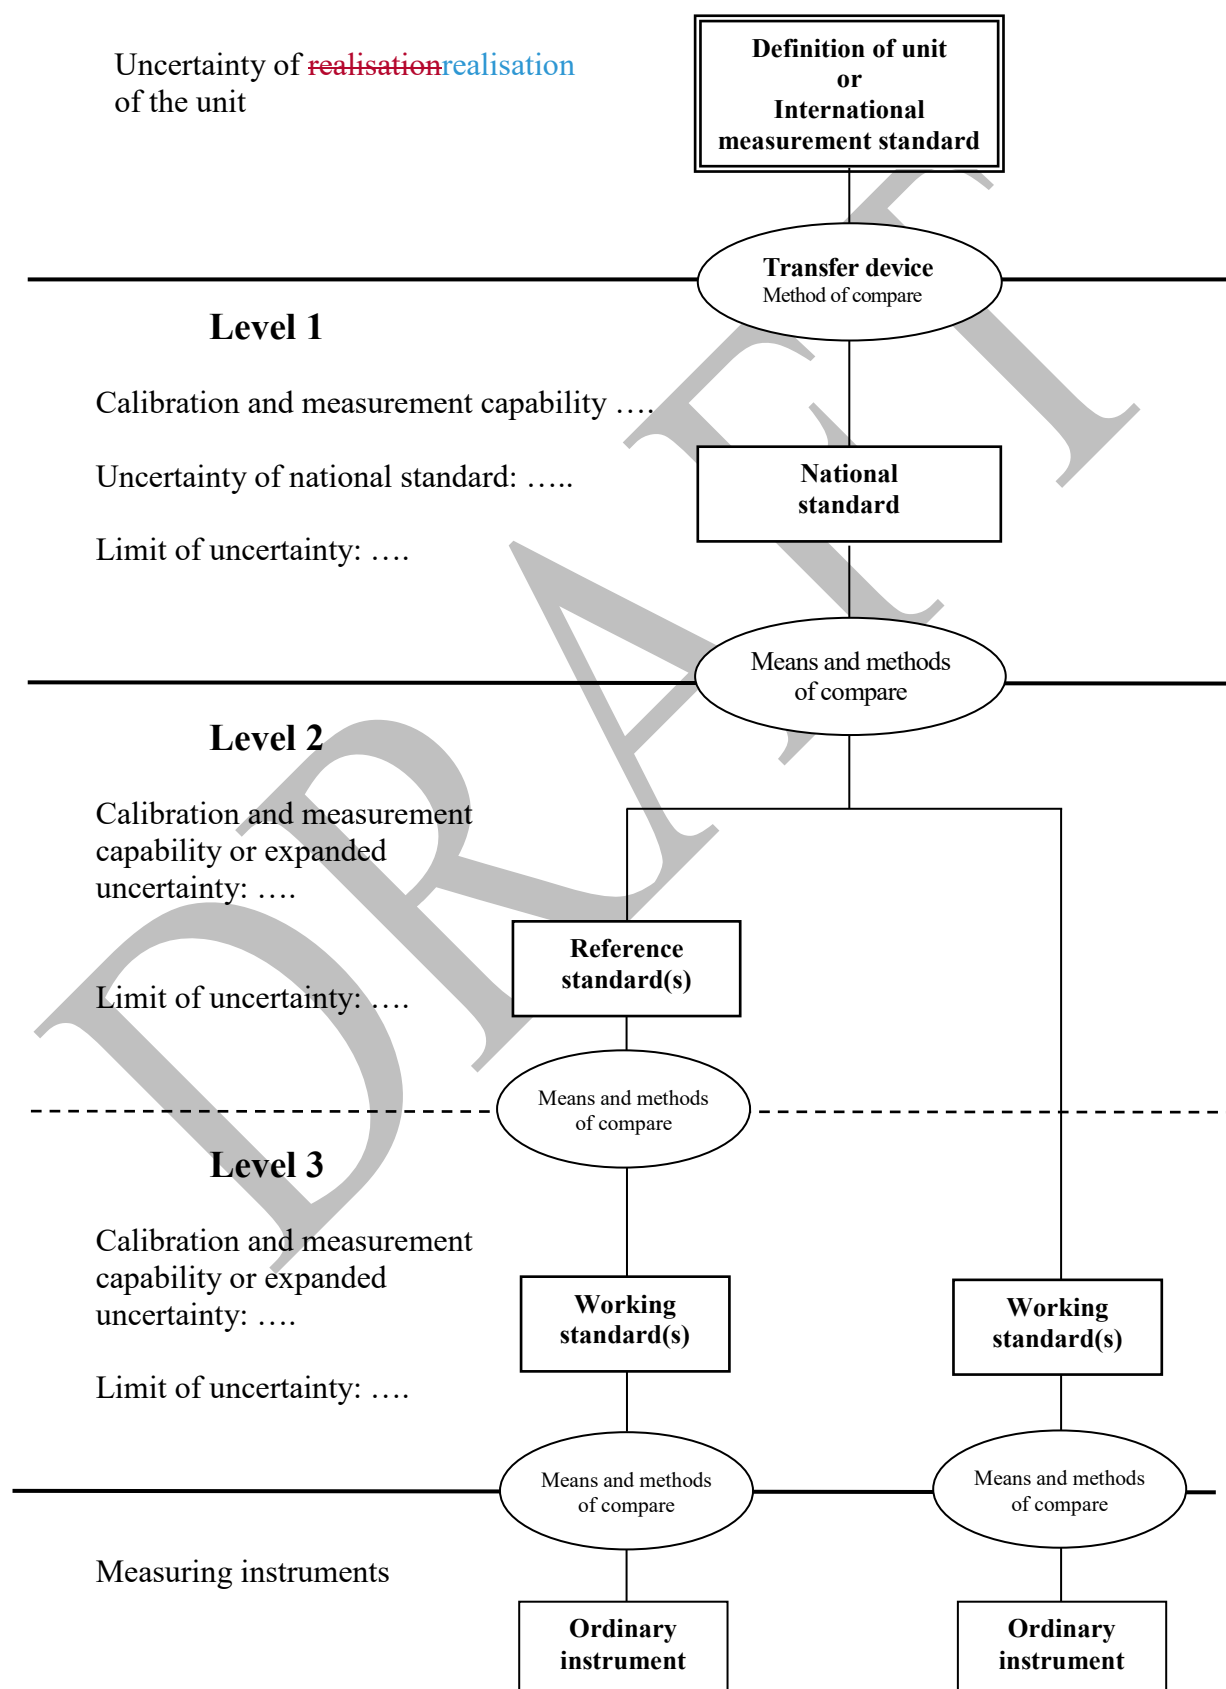

- a) kinds of verified or calibrated measuring instruments and their measurement ranges,
- b) metrological characteristics of ~~the~~ measuring instrument (accuracy class or ~~the~~ maximum permissible errors, nominal range, instrument constant, discrimination threshold, resolution, stability, etc.).
